American options

History and
background

The blow-up
technique

Application to
indifference pricing

American option

- ▶ A contract on one or several underlying assets that can be exercised during some predetermined period $[t, T]$.
- ▶ Payoff $g : \mathbb{R}^n \rightarrow \mathbb{R}$ at exercise $\tau \in [t, T]$.

Early exercise
boundary
regularity close to
expiry in
indifference setting

Teitur Arnarson
KTH, Stockholm

American options

History and
background

The blow-up
technique

Application to
indifference pricing

Example: American put option

Gives you the right, but not the obligation, to sell the underlying stock X_s for a predetermined price K any time $s \in [t, T]$.

Early exercise
boundary
regularity close to
expiry in
indifference setting

American options

History and
background

The blow-up
technique

Application to
indifference pricing

Example: American put option

Gives you the right, but not the obligation, to sell the underlying stock X_s for a predetermined price K any time $s \in [t, T]$.

At exercise τ the payoff is $g(X_\tau) = \max(K - X_\tau, 0)$.

History and
background

The blow-up
technique

Application to
indifference pricing

Complete markets

The market consists of

- ▶ non-risky asset

$$dB_s = \rho B_s ds$$

$$B_t = B.$$

- ▶ traded asset

$$dX_s = \mu X_s ds + \sigma X_s dW_s$$

$$X_t = x$$

W_s is Brownian motion.

The blow-up
technique

Application to
indifference pricing

The price h of an American option with payoff g is given by

Theorem (Risk-neutral valuation formula)

$$h(x, t) = \sup_{\tau \in [t, T]} e^{-\rho(\tau-t)} E(g(X_\tau) | X_t = x).$$

Variational inequality

h solves the following linear variational inequality

$$\min \left(-h_t - \frac{1}{2}\sigma^2 x^2 h_{xx} - \rho x h_x + \rho h, \right. \\ \left. h(x, t) - g(x) \right) = 0 \quad \text{in } \mathbb{R} \times [0, T) \\ h(x, T) = g(x) \quad \text{in } [0, T)$$

Early exercise
boundary
regularity close to
expiry in
indifference setting

Teitur Arnarson
KTH, Stockholm

American options

History and
background

The blow-up
technique

Application to
indifference pricing

Variational inequality

h solves the following linear variational inequality

$$\min \left(-h_t - \frac{1}{2}\sigma^2 x^2 h_{xx} - \rho x h_x + \rho h, \right. \\ \left. h(x, t) - g(x) \right) = 0 \quad \text{in } \mathbb{R} \times [0, T) \\ h(x, T) = g(x) \quad \text{in } [0, T)$$

A *free boundary* Γ separates the sets

$$\mathcal{C} = \left\{ -h_t - \frac{1}{2}\sigma^2 x^2 h_{xx} - \rho x h_x + \rho h = 0 \right\} \\ \mathcal{O} = \{ h - g = 0 \}.$$

Early exercise

Independent results for the American put.

- ▶ Kuske & Keller (1998)
- ▶ Bunch & Johnsson (2000)
- ▶ Stamicar, Sevcovic & Chadam (1999)

Early exercise
boundary
regularity close to
expiry in
indifference setting

Teitur Arnarson
KTH, Stockholm

American options

History and
background

The blow-up
technique

Application to
indifference pricing

In dimensionless variables the price function $\tilde{h}(x, t)$ solves

$$\begin{aligned}\tilde{h}_t - \tilde{h}_{xx} - (k-1)\tilde{h}_x + k\tilde{h} &= 0 && \text{for } x > \tilde{\beta}(t) \\ \tilde{h} &= 1 - e^x && \text{for } x < \tilde{\beta}(t) \\ \tilde{h}(0, x) &= (1 - e^x)^+, && \end{aligned}$$

where $x = \tilde{\beta}(t)$ is a parameterization of the free boundary Γ .

Fundamental solution

Early exercise
boundary
regularity close to
expiry in
indifference setting

Teitur Arnarson
KTH, Stockholm

American options

History and
background

The blow-up
technique

Application to
indifference pricing

Find the fundamental solution for the PDE

$$\Phi(x, t) = \frac{1}{2\sqrt{\pi t}} \exp\left\{-\frac{(x + (k-1)t)^2}{4t}\right\}$$

and get the following integral representation

$$\begin{aligned}\tilde{h}(x, t) &= \int_{-\infty}^0 (1 - e^y) \Phi(x - y, t) dy \\ &+ k \int_0^t \int_{-\infty}^{\tilde{\beta}(t-\theta)} \Phi(x - y, \theta) dy d\theta.\end{aligned}$$

ODE for the free boundary

Derive an ODE for the free boundary

$$\dot{\tilde{\beta}} = -\frac{2\Phi_x(\tilde{\beta}(t), t)}{k} - 2 \int_0^t \Phi_x(\tilde{\beta}(t) - \tilde{\beta}(t - \theta), \theta) \dot{\tilde{\beta}}(t - \theta) d\theta.$$

Early exercise
boundary
regularity close to
expiry in
indifference setting

ODE for the free boundary

Early exercise
boundary
regularity close to
expiry in
indifference setting

Teitur Arnarson
KTH, Stockholm

American options

History and
background

The blow-up
technique

Application to
indifference pricing

Derive an ODE for the free boundary

$$\dot{\tilde{\beta}} = -\frac{2\Phi_x(\tilde{\beta}(t), t)}{k} - 2 \int_0^t \Phi_x(\tilde{\beta}(t) - \tilde{\beta}(t - \theta), \theta) \dot{\tilde{\beta}}(t - \theta) d\theta.$$

Asymptotic expansion

$$\frac{\tilde{\beta}^2}{4t} = -\xi - \frac{1}{2\xi} + \frac{1}{8\xi^2} + \frac{17}{24\xi^3} + \dots$$

where $\xi = \sqrt{4\pi k^2 t}$.

Summary of the expansion method

Advantage

- ▶ Good precision

Drawback

- ▶ One-dimensional, linear setting.

The blow-up
technique

Application to
indifference pricing

Under standard assumptions on F the scaled function u_r solves

$$\min(D_t u_r - F_r(D^2 u_r, Du_r, u_r, x, t),$$

$$u_r - g_r) = 0 \quad \text{in } B_{1/r} \times (0, \frac{1}{r^2})$$

$$u_r(x, 0) = g_r(x) \quad \text{in } B_{1/r}.$$

Blow-up limit

Early exercise
boundary
regularity close to
expiry in
indifference setting

Teitur Arnarson
KTH, Stockholm

American options

History and
background

The blow-up
technique

Application to
indifference pricing

Take the so called *blow-up limit* by letting $r \rightarrow 0$.

If we have the right growth and continuity of u the limit function $u_0 = \lim_{r \rightarrow 0} u_r$ will solve

$$\begin{aligned} \min(D_t u_0 - F(D^2 u_0, 0, 0, 0, 0), u_0 - g_0) &= 0 \quad \text{in } \mathbb{R} \times \mathbb{R}^+ \\ u_0(x, 0) &= g_0(x) \quad \text{in } \mathbb{R}. \end{aligned}$$

Free boundary regularity

The blow-up limit problem

- ▶ For the limit problem no lower order terms occur in the PDE.
- ▶ The limit obstacle g_0 is possibly simpler than the original g .

Different scenarios that might occur for the limit problem:

- ▶ The obstacle is a *strict* subsolution to the differential operator.
- ▶ We can find an analytic solution.

Theorem 2 There exists a modulus of continuity $\sigma(r)$ such that

$$(\beta(t), t) \in \{(y, t) : t < (y - K)^2 \sigma(y - K)\}.$$

Proof

★ Scale by r

$$h_r(y, t) = \frac{h(ry + K, r^2 t)}{r}$$

and take limit $r \rightarrow 0$

$$\begin{aligned} \min(D_t h_0 - \frac{1}{2} a_0^2 D_y^2 h_0, h_0 - g_0) &= 0 \\ h_0(y, 0) &= g_0(y) \end{aligned}$$

indifference pricing

Proof

- ★ Scale by r

$$h_r(y, t) = \frac{h(ry + K, r^2 t)}{r}$$

and take limit $r \rightarrow 0$

$$\begin{aligned} \min(D_t h_0 - \frac{1}{2} a_0^2 D_y^2 h_0, h_0 - g_0) &= 0 \\ h_0(y, 0) &= g_0(y) \end{aligned}$$

- ★ $g_0 = y^+$ is a strict subsolution to the limit PDE.

The limit problem does not have a free boundary.

$$(\beta(t), t) \in \{t < (y - K)^2 \sigma(y - K)\}.$$
